UNITED STATES PATENT AND TRADEMARK OFFICE

I, Susan POTTS BA ACIS,

Director of RWS Group plc, of Europa House, Marsham Way, Gerrards Cross, Buckinghamshire, England declare;

1. That I am a citizen of the United Kingdom of Great Britain and Northern Ireland.
2. That the translator responsible for the attached translation is well acquainted with the French and English languages.
3. That the attached is, to the best of RWS Group plc knowledge and belief, a true translation into the English language of the specification in French filed with the application for a patent in the U.S.A. on  
under the number
4. That I believe that all statements made herein of my own knowledge are true and that all statements made on information and belief are true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the patent application in the United States of America or any patent issuing thereon.

---

For and on behalf of RWS Group plc  
The 19th day of February 2002

PROVISIONAL APPLICATION

1

The present invention relates to a care composition and/or treatment composition and/or make-up composition for the skin, including the scalp, and/or  
5 the lips of humans, containing a liquid fatty phase containing a fluoro oil, structured with a particular polymer. This composition is especially in the form of a make-up stick and more especially a lipstick, which, when applied, gives a noteworthy shiny, non-sticky,  
10 transfer-resistant deposit.

It is common to find a structured, i.e. gelled and/or rigidified, liquid fatty phase in cosmetic or dermatological products; this is especially the case in solid compositions such as deodorants, lip  
15 balms, lipsticks, concealer products and cast foundations. This structuring is obtained with the aid of waxes and/or fillers. Unfortunately, these waxes and fillers have a tendency to make the composition matt, which is not always desirable, in particular for a  
20 lipstick; specifically, women are always looking for lipstick in the form of a tube depositing a film that is increasingly glossy.

For the purposes of the invention, the expression "liquid fatty phase" means a fatty phase  
25 that is liquid at room temperature (25°C), composed of one or more fatty substances that are liquid at room

temperature, also known as oils, that are generally mutually compatible.

The structuring of the liquid fatty phase makes it possible in particular to limit its exudation from solid compositions, in particular in hot and humid regions, and in addition to limit, after deposition on the skin or the lips, the migration of this phase into the wrinkles and fine lines, which is particularly desired for a lipstick. Specifically, significant migration of the liquid fatty phase, in particular when it is charged with dyestuffs, leads to an unaesthetic effect around the lips and the eyes, which particularly accentuates the wrinkles and fine lines. This migration is often mentioned by women as being a major defect of conventional lipsticks.

The gloss is essentially associated with the nature of the liquid fatty phase. Thus, it is possible to reduce the content of waxes and of fillers in the composition in order to increase the gloss of a lipstick, but in this case the migration of the liquid fatty phase increases. In other words, the content of waxes and of fillers required to prepare a stick of suitable hardness which does not exude at room temperature is a restricting factor on the gloss of the deposit.

The Applicant has found that the loss of gloss of a stick containing waxes is associated with

the anisotropic crystal structure of these compounds. It has therefore envisaged manufacturing a stick while reducing the amount of waxes and/or fillers.

Furthermore, most make-up compositions or  
5 care compositions, when applied to the skin, the  
eyelashes or the lips, have the drawback of  
transferring, i.e. of becoming at least partly  
deposited, leaving marks, on certain supports with  
which they may come into contact, and especially a  
10 glass, a cup, a cigarette, an item of clothing or the  
skin. This results in mediocre persistence of the film  
applied, making it necessary to regularly reapply the  
composition, especially a foundation or lipstick.  
However, users nowadays wish to achieve a beauty  
15 enhancement of their face, including the lips, and  
their body while spending as little time as possible  
doing so. Moreover, the appearance of these  
unacceptable marks, especially on blouse collars, may  
put certain women off using this type of make-up.

20           Cosmeticians have been interested for many  
years in "transfer-resistant" lipstick compositions and  
more recently in transfer-resistant foundation  
compositions. Thus, the company Shiseido at envisaged,  
in its patent application JP-A-61-65809, transfer-  
25 resistant lipstick compositions containing a  
siloxysilicate resin (with a three-dimensional  
network), a volatile silicone oil containing a cyclic

silicone chain and pulverulent fillers. Similarly, the company Noevier at disclosed, in document JP-A-62-61911, transfer-resistant lipstick, eyeliner and foundation compositions comprising one or more  
5 volatile silicones combined with one or more hydrocarbon-based waxes.

Although these compositions have improved transfer-resistance properties, they have the drawback of leaving on the lips, after the silicone oils have  
10 evaporated off, a film which becomes uncomfortable over time (sensation of drying out and of tautness), which puts a certain number of women off this type of lipstick. In addition, the film deposited is matt.

Patent application EP-A-0 749 746 from  
15 L'Oréal discloses lipstick compositions containing a dispersion of polymer particles that are surface-stabilized with a polymer stabilizer. These compositions have the drawback of containing only a small proportion of polar oils that are known to give  
20 sheen to the film deposited, in conventional compositions. In particular, the presence of a large proportion of polar oils (at least 5%) results in flocculation of the particles and thus instability over time of the compositions.

25 A need thus remains for a composition which does not have the above drawbacks, and which especially has noteworthy transfer-resistance properties, even in

the case of a pronounced pressure or friction, good staying power over time, a glossy appearance, and which is not sticky and does not dry out the skin or the lips onto which it is applied, either during application or  
5 over time. Furthermore, this composition is stable over time and easy to manufacture, and it is easy to introduce pigments therein.

A subject of the invention is, precisely, a care composition and/or make-up composition and/or  
10 treatment composition for the skin and/or the lips of the face and/or for integuments, which overcomes the drawbacks mentioned above.

Surprisingly, the Applicant has found that the use of particular polymers combined with a fluoro  
15 oil makes it possible to obtain a stick which, when applied to the lips, gives a film with noteworthy cosmetic properties. In particular, the film is glossy, flexible, comfortable, "transfer-resistant" and non-sticky. In addition, the film shows good homogeneity.  
20 Furthermore, the composition is stable over time and does not exude at room temperature.

Moreover, when the fluoro oil is a silicone fluoro oil, the said oil is highly compatible with non-fluoro silicone oils: it is then possible to  
25 incorporate a larger amount of silicone oil into the composition, which further promotes the staying power of the lipstick.

The term "stable" means a composition that does not exude at room temperature for at least 2 minus, or even up to 9 months.

The invention applies not only to make-up products for the lips, such as lipsticks, lip glosses and lip pencils, but also to care and/or treatment products for the skin, including the scalp, and for the lips, such as antisen products especially in stick form for the skin of the face, the body or the lips, make-up products for the skin, both of the human face and of the human body, such as foundations optionally cast in stick or dish form, concealer products, eye shadows, and transfer tattoos, body hygiene products such as deodorants, especially in stick form, shampoos, conditioners and make-up products for the eyes such as eyeliners, eye pencils and mascaras, more especially in cake form, as well as care products for the face, the body and keratin fibres such as the hair and the eyebrows.

More specifically, a subject of the invention is a structured composition containing at least one liquid fatty phase comprising at least one fluoro oil, the liquid fatty phase being structured with at least one polymer with a weight-average molecular mass of less than or equal to 100 000, comprising a) a polymer skeleton having hydrocarbon-based repeating units containing at least one hetero atom, and b) optionally

pendent and/or terminal fatty chains that are optionally functionalized, containing from 6 to 120 carbon atoms and being linked to these hydrocarbon-based units, the liquid fatty phase and the polymer  
5 forming a physiologically acceptable medium.

The composition of the invention advantageously contains no silicone resin containing siloxysilicate or trimethylated silica units, so as to preserve the comfort properties of the composition.

10 The composition of the invention can be in the form of a paste, a solid or a more or less viscous cream. It can be an oil-in-water or water-in-oil emulsion, or a rigid or soft anhydrous gel. In particular, it is in a form cast as a stick or a dish  
15 and more especially in the form of an anhydrous rigid gel, especially an anhydrous stick. More especially, it is in the form of a rigid gel that is translucent or transparent, the liquid fatty phase forming the continuous phase.

20 The gelling of the oil can be modified according to the nature of the hetero atom-containing polymer used, and may be such that a rigid structure in the form of a tube or a stick is obtained. When these tubes are coloured, they make it possible, after  
25 application, to obtain a glossy deposit of uniform colour, that does not transfer, in particular onto a support placed in contact with the film, after

evaporation of the volatile solvent, and that has good staying power, especially of the colour over time.

The structuring polymer of the composition of the invention is a solid that is undeformable at room  
5 temperature (25°C). It is capable of structuring the composition without opacifying it.

For the purposes of the invention, the expression "functionalized chains" means an alkyl chain comprising one or more functional or reactive groups  
10 chosen in particular from amide, hydroxyl, ether, oxyalkylene, polyoxyalkylene, halogen, including fluoro or perfluoro, ester, siloxane and polysiloxane groups. In addition, the hydrogen atoms of one or more fatty chains may be substituted at least partially with  
15 fluorine atoms.

According to the invention, these chains may be linked directly to the polymer skeleton or via an ester function or a perfluoro group.

For the purposes of the invention, the term  
20 "polymer" means a compound containing at least 2 repeating units and preferably at least 3 repeating units, which are identical.

For the purposes of the invention, the expression "hydrocarbon-based repeating units" means a  
25 unit containing from 2 to 80 carbon atoms and preferably from 2 to 60 carbon atoms, bearing hydrogen atoms and optionally oxygen atoms, which may be linear,

branched or cyclic, and saturated or unsaturated. These units each also comprise one or more hetero atoms that are advantageously non-pendent and are in the polymer skeleton. These hetero atoms are chosen from nitrogen, sulphur and phosphorus atoms and combinations thereof, optionally combined with one or more oxygen atoms. Preferably, the units comprise at least one nitrogen atom, in particular a non-pendent nitrogen atom. These units also advantageously comprise a carbonyl group.

10           The units containing a hetero atom are, in particular, amide units forming a skeleton of the polyamide type, carbamate and/or urea units forming a polyurethane, polyurea and/or polyurea-urethane skeleton. These units are preferably amide units. The pendent chains are advantageously linked directly to at least one of the hetero atoms of the polymer skeleton. According to one embodiment, the first polymer comprises a polyamide skeleton.

20           Between the hydrocarbon-based units, the polymer may comprise silicone units or oxyalkylene units.

          In addition, the polymer in the composition of the invention advantageously comprises a total number of fatty chains which represents from 40% to 98% of the total number of units containing a hetero atom and of fatty chains, and better still from 50% to 95%. The nature and proportion of the units containing a

hetero atom depends on the nature of the organic phase and is, in particular, similar to the polar nature of the organic phase. Thus, the more the units containing a hetero atom are polar and in high proportion in the first polymer, which corresponds to the presence of several hetero atoms, the greater the affinity of the first polymer for polar oils. Conversely, the more the units containing a hetero atom are non-polar, or even apolar, or the lower the proportion thereof, the greater the affinity of the first polymer for apolar oils.

A subject of the invention is also a structured composition containing at least one liquid fatty phase comprising at least one fluoro oil, the liquid fatty phase being structured with at least one polyamide with a weight-average molecular mass of less than 100 000, comprising a) a polymer skeleton containing amide repeating units and b) optionally pendent and/or terminal fatty chains that are optionally functionalized, containing from 6 to 120 carbon atoms and being linked to these amide units, the liquid fatty phase and the polymer forming a physiologically acceptable medium.

The pendent fatty chains are preferably linked to at least one of the nitrogen atoms in the amide units of the polymer.

In particular, the fatty chains of this polyamide represent from 40% to 98% relative to the total number of amide units and of fatty chains, and better still from 50% to 95%.

5            Advantageously, the polymer and in particular the polyamide in the composition according to the invention has a weight-average molecular mass of less than or equal to 100 000 (in particular ranging from 1 000 to 100 000), in particular less than or equal to  
10 50 000 (especially ranging from 1 000 to 50 000), more particularly ranging from 1 000 to 30 000, preferably from 2 000 to 20 000 and better still from 2 000 to 10 000.

As preferred structuring polymers which may  
15 be used in the invention, mention may be made of polyamides branched with pendent fatty chains and/or terminal fatty chains having from 12 to 120 carbon atoms and especially from 12 to 68 carbon atoms, the terminal fatty chains being linked to the polyamide  
20 skeleton via ester groups. These polymers are more especially those disclosed in document US-A-5 783 657 from the company Union Camp. Each of these polymers in particular satisfies formula (I) below:

in which n denotes a number of amide units such that the number of ester groups represents from 10% to 50% of the total number of ester and amide groups; R<sup>1</sup> is, independently in each case, an alkyl or alkenyl group containing at least 4 carbon atoms; R<sup>2</sup> represents, independently in each case, a C<sub>4</sub> to C<sub>42</sub> hydrocarbon-based group, on condition that 50% of the groups R<sup>2</sup> represent a C<sub>30</sub> to C<sub>42</sub> hydrocarbon-based group; R<sup>3</sup> represents, independently in each case, an organic group containing at least 2 carbon atoms, hydrogen atoms and optionally one or more oxygen or nitrogen atoms; and R<sup>4</sup> represents, independently in each case, a hydrogen atom, a C<sub>1</sub> to C<sub>10</sub> alkyl group or a direct bond to R<sup>3</sup> or to another R<sup>4</sup>, such that the nitrogen atom to which R<sup>3</sup> and R<sup>4</sup> are both attached forms part of a heterocyclic structure defined by R<sup>4</sup>-N-R<sup>3</sup>, with at least 50% of the groups R<sup>4</sup> representing a hydrogen atom.

In particular, the ester groups of formula (I), which form part of the terminal and/or pendent fatty chains for the purposes of the invention, represent from 15% to 40% of the total number of ester and amide groups and better still from 20% to 35%. Furthermore, n is advantageously an integer ranging from 1 to 5. Preferably, R<sup>1</sup> is a C<sub>12</sub> to C<sub>22</sub> and preferably C<sub>16</sub> to C<sub>22</sub> alkyl group. Advantageously, R<sup>2</sup> can be a C<sub>10</sub> to C<sub>42</sub> hydrocarbon-based (especially alkyl or

alkenyl) group having the structure of a polymerized fatty acid or of a dimer from which the carboxylic acid groups have been removed (these groups serving for the formation of an amide). Preferably, at least 50% and  
5 better still at least 75% of the groups  $R^2$  are groups containing from 30 to 42 carbon atoms. The other groups  $R^2$  are  $C_4$  to  $C_{19}$  and better still  $C_4$  to  $C_{12}$  hydrogen-containing groups. Preferably,  $R^3$  represents a  $C_2$  to  $C_{36}$  hydrocarbon-based group or a polyoxyalkylene group and  
10  $R^4$  represents a hydrogen atom. Preferably,  $R^3$  represents a  $C_2$  to  $C_{12}$  hydrocarbon-based group. The hydrocarbon-based groups may be linear, cyclic or branched, and saturated or unsaturated groups. Moreover, the alkyl and alkenyl groups may be linear or branched groups.

15 According to the invention, the structuring of the liquid fatty phase is obtained with the aid of one or more polymers of formula (I). In general, the polymers of formula (I) are in the form of mixtures of polymers, these mixtures also possibly containing a  
20 synthetic product such as  $n$  is 0, i.e. a diester.

As examples of structuring polymers which can be used in the composition according to the invention, mention may be made of the commercial products sold by the company Bush Boake Allen under the names  
25 Uniclear 80 and Uniclear 100. They are sold, respectively, in the form of an 80% (in terms of active material) gel in a mineral oil and a 100% (in terms of

active material) gel. They have a softening point of from 88 to 94°C. These commercial products are a mixture of a copolymer of a C<sub>36</sub> diacid coupled with ethylenediamine, having an average molecular mass of  
5 about 6 000. The remaining acid endings are, moreover, esterified with cetylstearyl alcohol).

As structuring polymers which can be used in the invention, mention may also be made of polyamide resins resulting from the condensation of an aliphatic  
10 dicarboxylic acid and a diamine (including compounds containing more than 2 carbonyl groups and 2 amine groups), the carbonyl and amine groups of adjacent individual units being condensed via an amide bond. These polyamide resins are, in particular, those sold  
15 under the brand name Versamid® by the companies General Mills Inc. and Henkel Corp. (Versamid 930, 744 or 1655) or by the company Olin Mathieson Chemical Corp. under the brand name Onamid®, in particular Onamid S or C. These resins have a weight-average molecular mass  
20 ranging from 6 000 to 9 000. For further information regarding these polyamides, reference may be made to the documents US-A-3 645 705 and US-A-3 148 125. More especially, Versamid® 930 or 744 is used.

The polyamides sold by the company Union Camp  
25 Corp. under the references Uni-Rez® (2658, 2931, 2970, 2621, 2613, 2624, 2665, 1554, 2623 and 2662) and the product sold under the reference Macromelt 6212 by the

company Henkel may also be useful. For further information regarding these polyamides, reference may be made to document US-A-5 500 209.

It is also possible to use polyamide resins  
5 derived from plants, such as those described in patents US-A-5 783 657 and US-A-5 998 570, the content of which is incorporated into the present patent application by way of reference.

The structuring polymers in the composition  
10 of the invention advantageously have a softening point of greater than 70°C, and which may be up to 190°C. It preferably has a softening point ranging from 80 to 130°C. These polymers are, in particular, non-waxy polymers.

15 The term "fluoro oil" means any liquid fatty substance containing at least one fluorine atom. The fluoro oil may especially be a volatile fluoro oil. It preferably has a density of greater than about 1, for example greater than about 1.1, especially greater than  
20 about 1.2. It may have a saturating vapour pressure, at 25°C, at least equal to 50 Pa, for example greater than 2 000 Pa and preferably greater than 4 000 Pa.

The fluoro oil may advantageously have a boiling point (at ambient pressure, i.e. 760 mmHg or  
25 10<sup>5</sup> Pa) of between 20 and 75°C and preferably between 25 and 65°C.

Fluoro oils which may be used in the invention include:

i) fluorosilicone compounds of formula (II):

5

in which:

- R represents a linear or branched divalent alkyl group containing 1 to 6 carbon atoms, preferably a divalent methyl, ethyl, propyl or butyl group,
- R<sub>f</sub> represents a fluoroalkyl radical, especially a perfluoroalkyl radical, containing 1 to 9 carbon atoms, preferably 1 to 4 carbon atoms,
- R<sub>1</sub> represents, independently of each other, a C1-C20 alkyl radical, a hydroxyl radical or a phenyl radical,
- m is chosen from 0 to 150 and preferably from 20 to 100, and
- n is chosen from 1 to 300 and preferably from 1 to 100.

20 Preferably, the groups R<sub>1</sub> are identical and represent a methyl radical.

In one particularly preferred embodiment, the fluorosilicone compound used according to the invention is of formula (III) below:

with

- 5 - R representing a divalent methyl, ethyl, propyl or butyl group,
- m being chosen from 0 to 80, and
- n being chosen from 1 to 30.

Such compounds are, especially, those sold by  
 10 the company Shin Etsu under the names 'X22-819',  
 'X22-820', 'X22-821' and 'X22-822' or 'FL-100'.

ii) the perfluorocycloalkyl compounds of formula (IV)  
 below:

15

in which n is equal to 4 or 5, m is equal to 1 or 2,  
 and p is equal to 1, 2 or 3;  
 with the proviso that when g = 2, the groups are not  
 20 necessarily alpha to each other.

Among the compounds of formula (IV) that may  
 especially be mentioned are perfluoromethylcyclopentane  
 and perfluorodimethylcyclohexane, sold, respectively,

under the names "Flutec PC1®" with a vapour pressure of 368 mbar, and "Flutec PC3®" by the company BNFL Fluorochemicals Ltd, and also perfluorodimethyl-cyclobutane.

- 5   iii) the fluoroalkyl or heterofluoroalkyl compounds corresponding to formula (V) below:

- 10   in which t is 0 or 1; n is 0, 1, 2 or 3; X is a linear or branched divalent perfluoroalkyl radical containing from 2 to 5 carbon atoms, and Z represents O, S or NR, R being hydrogen, a radical  $-(\text{CH}_2)_n-\text{CH}_3$  or  $-(\text{CF}_2)_m-\text{CF}_3$ , m being 2, 3, 4 or 5.

- 15           Among the fluoroalkyl or heterofluoroalkyl compounds of formula (V) that may especially be mentioned are methoxynonafluorobutane sold under the name "MSX 4518®", "HFE-7100®" by the company 3M and ethoxynonafluorobutane sold under the name "HFE-7200®"
- 20   by the company 3M.

- iv) the perfluoroalkane compounds corresponding to formula (VI) below:

25

in which n is 2 to 6.

Among the perfluoroalkane compounds of formula (VI) that may especially be mentioned are dodecafluoropentane and tetradecafluorohexane.

v) the perfluoromorpholine derivatives corresponding to formula (VII) below:

in which R represents a C<sub>1</sub>-C<sub>4</sub> perfluoroalkyl radical.

Among the perfluoromorpholine derivatives of formula (VII) that may especially be mentioned are 4-trifluoromethylperfluoromorpholine and 4-pentafluoroethylperfluoromorpholine.

(vi) the perfluoropolyethers corresponding to formulae (VIII) and (IX) below:

in which n is 7 to 30; and

the ratio m/p being from 20 to 40, and the molecular weight ranging from 500 to 20 000.

Among these perfluoropolyethers of formulae (VIII) and (IX), mention may be made, respectively, of the product sold under the name "Fluortress LM36®" by the company DuPont, and those sold under the general name "Fomblin" by the company Montefluos, for example Fomblin HC R®.

It is also possible to use the perfluoropolyethers mentioned in patent application EP-A-641 194, the content of which is incorporated into the present patent application by way of reference. vii) the fluorosilicone compounds corresponding to formula (X) below:

in which k is 1 to 17, l is 1 to 18, p is 1 to 6 and R<sub>1</sub> represents a hydrogen atom or a C<sub>1</sub>-C<sub>6</sub> alkyl radical; R<sub>2</sub> represents a C<sub>1</sub>-C<sub>6</sub> alkyl radical or a radical -OSi(R<sub>3</sub>)<sub>3</sub>, and R<sub>3</sub> represents a C<sub>1</sub>-C<sub>4</sub> alkyl radical.

Among the compounds corresponding to formula (IV), mention may especially be made of:

- N-(2-F-octylethyloxycarbonyl)-3-aminopropylbis(trimethylsiloxy)methylsilane,

- N-(2-F-hexylethyloxycarbonyl)-3-aminopropylbis(trimethylsiloxy)methylsilane,
- N-(2-F-butylethyloxycarbonyl)-3-aminopropylbis(trimethylsiloxy)methylsilane,
- N-(2-F-octylethyloxycarbonyl)-3-aminopropyltris(trimethylsiloxy)silane,
- N-(2-F-hexylethyloxycarbonyl)-3-aminopropyltris(trimethylsiloxy)silane, and
- N-(2-F-butylethyloxycarbonyl)-3-aminopropyltris(trimethylsiloxy)silane.

viii) the fluoroalkylsilicones corresponding to one of the formulae (XI) and/or (XII) below:

15

in which  $R_1$  and  $R'_1$  independently represent a linear or branched alkyl radical containing from 1 to 6 carbon atoms, or a phenyl radical,  
 $R_2$  represents  $R_1$ ,  $-OH$  or  $-(CH_2)_f-R_F$ ,  $f$  being an integer ranging from 0 to 10,

R<sub>3</sub> represents a linear or branched alkyl radical containing from 6 to 22 carbon atoms,

R<sub>F</sub> represents a radical of formula -(CF<sub>2</sub>)<sub>q</sub>-CF<sub>3</sub>, q being an integer ranging from 0 to 10,

25 m and n represent an integer ranging from 1 to 50, and

p represents an integer ranging from 0 to 2 000,

5 in which:

R<sub>4</sub> represents a linear or branched alkyl radical containing from 1 to 6 carbon atoms, or a phenyl radical,

10 R<sub>5</sub> represents a linear or branched alkyl radical containing from 6 to 22 carbon atoms, or a phenyl radical,

R'<sub>F</sub> represents a radical of formula -(CF<sub>2</sub>)<sub>s</sub>-CF<sub>3</sub>, s being an integer ranging from 0 to 15, and

t represents an integer ranging from 1 to 2 000.

15 According to one particular embodiment of the cosmetic compositions according to the invention, the fluoroalkylsilicone corresponds to formula (XI) in which:

R<sub>1</sub>, R'<sub>1</sub> and R<sub>2</sub> represent a methyl radical,

20 R<sub>3</sub> represents a linear alkyl radical containing from 6 to 22 carbon atoms,

m and n are integers ranging from 1 to 20, and

q is an integer ranging from 1 to 13.

25 According to another embodiment of the compositions according to the invention, the

fluoroalkylsilicone corresponds to formula (XII) in which:

$R_4$  represents a methyl radical,

$R_5$  represents a linear alkyl radical containing from 6  
5 to 22 carbon atoms, and

$s$  represents an integer ranging from 1 to 13.

The fluoroalkylsilicones as defined above are known compounds which have been described especially in patent US-5 473 038.

10 Fluoro oils which may also be used are the fluorohydrocarbons mentioned in patent application EP-A-609 132, the content of which is incorporated into the present patent application by way of reference.

The fluoro oil may be present in the  
15 composition according to the invention in a content ranging from 0.1% to 50% by weight, relative to the total weight of the composition, preferably ranging from 1% to 30% by weight and better still ranging from 3% to 15% by weight.

20 Advantageously, the polymer may be combined with at least one amphiphilic compound that is liquid and non-volatile at room temperature, with a hydrophilic/lipophilic balance (HLB) value of less than 12 and especially ranging from 1 to 8 and preferably  
25 from 1 to 5. According to the invention, one or more amphiphilic compounds may be used. The aim of these amphiphilic compounds is to reinforce the structuring

properties of the polymer containing a hetero atom, to make the polymer easier to use and to improve the ability of the stick to be deposited.

According to the invention, the composition  
5 can have a hardness ranging from 20 to 2 000 g, in particular from 20 to 1 500 g and better still from 20 to 900 g, for example from 50 to 600 g or better still from 150 to 450 g. This hardness may be measured according to a method of penetration of a probe into  
10 the said composition and in particular using a texture analyser (for example TA-XT2i from Rhéo) equipped with an ebonite cylinder 5 mm high and 8 mm in diameter. The hardness measurement is carried out at 20°C at the centre of 5 samples of the said composition. The  
15 cylinder is introduced into each composition sample at a pre-speed of 2 mm/s, then at a speed of 0.5 mm/s and finally at a post-speed of 2 mm/s, the total displacement being 1 mm. The hardness value taken is that of the maximum peak. The measurement error is  
20 +/- 50 g.

The hardness can also be measured by the "cheese wire" method, which consists in cutting a tube of lipstick 8.1 mm in diameter and in measuring the hardness at 20°C using a DFGHS 2 tensile testing  
25 machine from the company Indelco-Chatillon, travelling at a speed of 100 mm/minute. It is expressed as the shear force (expressed in grams) required to cut a

stick under these conditions. According to this method, the hardness of a composition in stick form according to the invention ranges from 30 to 300 g, better still from 30 to 250 g, especially from 30 to 150 g, 5 preferably from 30 to 120 g, and for example from 30 to 50 g.

The hardness of the composition according to the invention is such that the composition is self-supporting and can disintegrate easily to form a 10 satisfactory deposit on the skin and/or the lips and/or the integuments. In addition, with this hardness, the composition of the invention has good impact strength.

According to the invention, the composition in stick form has the behaviour of a deformable, 15 flexible elastic solid, giving noteworthy elastic softness on application. The compositions in stick form of the prior art do not have this property of elasticity and flexibility.

The amphiphilic compound(s) which can be used 20 in the composition of the invention comprise a lipophilic part linked to a polar part, the lipophilic part comprising a carbon-based chain containing at least 8 carbon atoms, in particular from 18 to 32 carbon atoms and better still from 18 to 28 carbon 25 atoms. The polar part of this or these amphiphilic compound(s) is preferably the residue of a compound chosen from alcohols and polyols containing from 1 to

12 hydroxyl groups, and polyoxyalkylenes comprising at least 2 oxyalkylene units and containing from 0 to 20 oxypropylene units and/or from 0 to 20 oxyethylene units. In particular, the amphiphilic compound is an ester chosen from the hydroxystearates, oleates and isostearates of glycerol, of sorbitan or of methylglucose, or alternatively branched C<sub>12</sub> to C<sub>26</sub> fatty alcohols such as octyldodecanol, and mixtures thereof. Among these esters, monoesters and mixtures of mono- and diesters are preferred.

The content of amphiphilic compound and that of the polymer containing a hetero atom are chosen according to the desired gel hardness and as a function of the specific application envisaged. The respective amounts of polymer and of amphiphilic compound should be such that they produce a stick which can be worn down. In practice, the amount of polymer represents from 0.5 to 80% of the total weight of the composition, and better still from 5% to 40%. The amount of amphiphilic compound in practice represents from 0.1% to 35% of the total weight of the composition and better still from 1% to 15%, if it is present.

The liquid fatty phase in the composition according to the invention may comprise an additional oil, other than the fluoro oil described above (the additional oil is thus a non-fluoro oil). In

particular, the additional oil may be a volatile oil or a non-volatile oil.

The liquid fatty phase of the composition advantageously contains more than 40% of liquid oil(s) containing a group similar to that of the units containing a hetero atom, and better still from 50% to 100%. In particular, the liquid fatty phase structured with a polyamide-type skeleton contains a high quantity, i.e. greater than 40% of the total weight of the liquid fatty phase and better still from 50% to 100%, of liquid apolar and more especially hydrocarbon-based oil or mixture of oils.

For a liquid fatty phase structured with a polymer containing a partially silicone-based skeleton, this fatty phase preferably contains more than 40% of the total weight of the liquid fatty phase and better still from 50% to 100%, of silicone-based liquid oil or mixture of oils, relative to the total weight of the liquid fatty phase.

For a liquid fatty phase structured with an apolar polymer of the hydrocarbon-based type, this fatty phase advantageously contains more than 40% by weight and better still from 50% to 100%, of liquid apolar and in particular hydrocarbon-based oil or mixture of oils, relative to the total weight of the liquid fatty phase.

In particular, the polar oils of the invention are:

- hydrocarbon-based plant oils with a high content of triglycerides consisting of fatty acid esters of glycerol in which the fatty acids may have varied chain lengths from  $C_4$  to  $C_{24}$ , these chains possibly being linear or branched, and saturated or unsaturated; these oils are, in particular, wheat germ oil, corn oil, sunflower oil, karite butter, castor oil, sweet almond oil, macadamia oil, apricot oil, soybean oil, cotton oil, alfalfa oil, poppy oil, pumpkin oil, sesame oil, marrow oil, rapeseed oil, avocado oil, hazelnut oil, grapeseed oil, blackcurrant seed oil, evening primrose oil, millet oil, barley oil, quinoa oil, olive oil, rye oil, safflower oil, candlenut oil, passionflower oil and musk rose oil; or alternatively caprylic/capric acid triglycerides such as those sold by the company Stearineries Dubois or those sold under the names Miglyol 810, 812 and 818 by the company Dynamit Nobel;
- synthetic oils or synthetic esters of formula  $R_5COOR_6$  in which  $R_5$  represents a linear or branched fatty acid residue containing from 1 to 40 carbon atoms and  $R_6$  represents an in particular branched hydrocarbon-based chain containing from 1 to 40 carbon atoms, on condition that  $R_5 + R_6 \geq 10$ , such as, for example, purcellin oil (cetostearyl octanoate), isononyl isononanoate,  $C_{12}$ - $C_{15}$  alkyl benzoate, isopropyl

myristate, 2-ethylhexyl palmitate, isostearyl isostearate, and alkyl or polyalkyl octanoates, decanoates or ricinoleates; hydroxylated esters such as isostearyl lactate and diisostearyl malate; and

5 pentaerythritol esters;

- synthetic ethers containing from 10 to 40 carbon atoms;

- C<sub>8</sub> to C<sub>26</sub> fatty alcohols such as oleyl alcohol;

- mixtures thereof.

10               The additional apolar oils according to the invention are, in particular, silicone oils such as volatile or non-volatile, linear or cyclic polydimethylsiloxanes (PDMSs) that are liquid at room temperature; polydimethylsiloxanes comprising alkyl, 15 alkoxy or phenyl groups which are pendent and/or at the end of the silicone chain, the groups each containing from 2 to 24 carbon atoms; phenylsilicones such as phenyl trimethicones, phenyl dimethicones, phenyl trimethylsiloxyl diphenylsiloxanes, diphenyl 20 dimethicones, diphenyl methyl diphenyl trisiloxanes and 2-phenylethyl trimethylsiloxysilicates; linear or branched hydrocarbons of synthetic or mineral origin, such as volatile or non-volatile liquid paraffins and derivatives thereof, petroleum jelly, liquid lanolin, 25 polydecenes, hydrogenated polyisobutene such as parleam, and squalane, and mixtures thereof.

The additional oils are preferably apolar oils and more especially an oil or a mixture of oils of the hydrocarbon-based type of mineral or synthetic origin, chosen in particular from hydrocarbons, especially alkanes such as parleam oil, isoparaffins such as isododecane, and squalane, and mixtures thereof. These oils are advantageously combined with one or more phenylsilicone oils.

The liquid fatty phase preferably contains at least one additional non-volatile oil chosen in particular from hydrocarbon-based oils of mineral, plant or synthetic origin, synthetic esters or ethers and silicone oils, and mixtures thereof.

In practice, the total liquid fatty phase represents from 5% to 99% of the total weight of the composition, preferably from 20% to 75%.

The liquid fatty phase of the composition according to the invention also contains at least one additional volatile solvent, other than the fluoro oils described above, namely one or more volatile solvents.

For the purposes of the invention, the expression "volatile solvent" means any non-aqueous medium capable of evaporating on contact with the skin or the lips in less than one hour at room temperature and atmospheric pressure. The volatile solvent(s) of the invention is(are) organic solvents and in particular volatile cosmetic oils that are liquid at

room temperature, having a non-zero vapour pressure, at room temperature and atmospheric pressure, ranging in particular from  $10^{-3}$  to 300 mmHg (0.013 Pa to 40 000 Pa) and preferably greater than 0.3 mmHg (30 Pa).

5           According to the invention, these volatile solvents facilitate, in particular, the application of the composition to the skin, the lips or the integuments. These solvents may be hydrocarbon-based solvents, silicone solvents optionally comprising alkyl  
10 or alkoxy groups that are pendent or at the end of a silicone chain, or a mixture of these solvents. Preferably, these solvents are not alcohols containing at least 7 carbon atoms.

          As volatile solvents which can be used in the  
15 invention, mention may be made of linear or cyclic silicone oils having a viscosity at room temperature of less than 8 cSt and in particular containing from 2 to 7 silicon atoms, these silicones optionally comprising alkyl or alkoxy groups containing from 1 to 10 carbon  
20 atoms. As volatile silicone oils which may be used in the invention, mention may be made in particular of octamethylcyclotetrasiloxane, decamethylcyclopentasiloxane, dodecamethylcyclohexasiloxane, heptamethylhexyltrisiloxane, heptamethyloctyltrisiloxane,  
25 hexamethyldisiloxane, octamethyltrisiloxane, decamethyltetrasiloxane and dodecamethylpentasiloxane, and mixtures thereof.

As other volatile solvents which may be used in the invention, mention may be made of hydrocarbon-based volatile oils containing from 8 to 16 carbon atoms, and mixtures thereof, and in particular branched

5 C<sub>8</sub>-C<sub>16</sub> alkanes such as C<sub>8</sub>-C<sub>16</sub> isoalkanes (also known as isoparaffins), isododecane, isodecane, isohexadecane and, for example, the oils sold under the trade names "Isopars" or "Permetyls", and branched C<sub>8</sub>-C<sub>16</sub> esters such as isohexyl neopentanoate, and mixtures thereof.

10 The volatile solvent is preferably chosen from hydrocarbon-based volatile oils containing from 8 to 16 carbon atoms, and mixtures thereof.

Isododecane (Permetyls 99 A) and C<sub>8</sub>-C<sub>16</sub> isoparaffins (Isopars L, E, H) and mixtures thereof,

15 optionally combined with decamethyltetrasiloxane, are preferably used.

The additional oils, especially the additional volatile oils, in particular represent a content by mass of from 5% to 97.5% relative to the

20 total weight of the composition, preferably from 10% to 75% and better still from 15% to 45%. In general, the amount of volatile solvent used is an amount which is sufficient to obtain transfer-resistance properties. This amount will be adapted by a person skilled in the

25 art according to the desired intensity of the transfer-resistance properties.

The composition of the invention can also comprise any additive usually used in the field under consideration, chosen in particular from dyestuffs, antioxidants, essential oils, preserving agents, 5 fragrances, fillers, waxes, products that are pasty at room temperature, neutralizers, polymers that are liposoluble or dispersible in the medium, cosmetic or dermatological active agents such as, for example, emollients, moisturizers, vitamins, essential fatty 10 acids, sunscreens, dispersants such as poly(12-hydroxystearic acid), and mixtures thereof. These additives may be present in the composition in a proportion of from 0% to 20% (in particular from 0.01% to 20%) relative to the total weight of the composition 15 and better still from 0.01% to 10%. The composition advantageously contains at least one cosmetic or dermatological active agent.

The composition of the invention can also contain, as additive, an aqueous phase containing water 20 that is optionally thickened or gelled with an aqueous-phase thickener or gelling agent and optionally water-miscible compounds.

Needless to say, a person skilled in the art will take care to select the optional additional 25 additives and/or the amount thereof such that the advantageous properties of the composition according to

the invention are not, or are not substantially, adversely affected by the envisaged addition.

The composition according to the invention can be in the form of a tinted dermatological or care composition for keratin materials such as the skin, the lips and/or the integuments, in the form of an antisen composition or body hygiene composition in particular in the form of a deodorant product or make-up-removing product in stick form. It can be used in particular as a care base for the skin, integuments or the lips (lip balms, for protecting the lips against cold and/or sunlight and/or the wind, or care cream for the skin, the nails or the hair).

The composition of the invention may also be in the form of a coloured make-up product for the skin, in particular a foundation, optionally having care or treatment properties, a blusher, a face powder, an eye shadow, a concealer product, an eyeliner, a make-up product for the body; a make-up product for the lips such as a lipstick, optionally having care or treatment properties; a make-up product for integuments such as the nails or the eyelashes, in particular in the form of a mascara cake, or for the eyebrows and the hair, in particular in the form of a pencil.

Needless to say, the composition of the invention should be cosmetically or dermatologically acceptable, i.e. it should contain a non-toxic

physiologically acceptable medium which should be able to be applied to the skin, integuments or the lips of human beings. For the purposes of the invention, the expression "cosmetically acceptable" means a

5 composition of pleasant appearance, odour and feel.

The composition advantageously contains at least one cosmetic active agent and/or one dermatological active agent and/or at least one dyestuff. By means of the combination of at least one  
10 volatile solvent and of at least one polymer with an average molecular mass of less than or equal to 100 000, as defined above, trapping of the active agents and dyestuffs present in the composition is obtained, making it possible to keep them where they  
15 were applied, i.e. on the lips, the skin or integuments such as keratin fibres, after the volatile solvent(s) has(have) evaporated off, and to limit their transfer or redeposition onto a support other than the one to which they were applied.

20 The dyestuff according to the invention may be chosen from the lipophilic dyes, hydrophilic dyes, pigments and naces usually used in cosmetic or dermatological compositions, and mixtures thereof. This dyestuff is generally present in a proportion of from  
25 0.01% to 50% of the total weight of the composition, preferably from 5% to 30%, if it is present.

The liposoluble dyes are, for example, Sudan Red, D&C Red 17, D&C Green 6,  $\beta$ -carotene, soybean oil, Sudan Brown, D&C Yellow 11, D&C Violet 2, D&C Orange 5, quinoline yellow or methyl yellow. They can represent  
5 from 0.1% to 20% of the weight of the composition and better still from 0.1% to 6%.

The pigments may be white or coloured, mineral and/or organic, and coated or uncoated. Among the mineral pigments which may be mentioned are  
10 titanium dioxide, optionally surface-treated, zirconium oxide or cerium oxide, as well as iron oxide, chromium oxide, manganese violet, ultramarine blue, chromium hydrate and ferric blue. Among the organic pigments which may be mentioned are carbon black, pigments of  
15 D&C type, and lakes based on cochineal carmine or on barium, strontium, calcium or aluminium. The pigments can represent from 0.1% to 50% and better still from 2% to 30% of the total weight of the composition, if they are present.

20 The nacreous pigments may be chosen from white nacreous pigments such as mica coated with titanium or with bismuth oxychloride, coloured nacreous pigments such as titanium mica with iron oxides, titanium mica with, in particular, ferric blue or  
25 chromium oxide, titanium mica with an organic pigment of the type mentioned above, as well as nacreous pigments based on bismuth oxychloride. They can

represent from 0.1% to 20% relative to the total weight of the composition, and better still from 0.1% to 15%, if they are present.

The composition can optionally contain one or  
5 more waxes to improve the structuring in stick form, although this rigid form can be obtained in the absence of wax. For the purposes of the present invention, a wax is a lipophilic fatty compound that is solid at room temperature (25°C), which undergoes a reversible  
10 solid/liquid change of state, having a melting point of greater than 40°C which may be up to 200°C, and having an anisotropic crystal organization in the solid state. The size of the crystals is such that the crystals diffract and/or scatter light, giving the composition a  
15 cloudy, more or less opaque appearance. By bringing the wax to its melting point, it is possible to make it miscible with oils and to form a microscopically homogeneous mixture, but, on returning the temperature of the mixture to room temperature, recrystallization  
20 of the wax in the oils of the mixture is obtained. It is this recrystallization in the mixture which is responsible for the reduction in the gloss of the said mixture. Thus, the composition advantageously contains little or no wax, and in particular less than 5% wax.

25 For the purposes of the application, the waxes are those generally used in cosmetics and dermatology; they are especially of natural origin, for

instance beeswax, carnauba wax, candelilla wax,  
ouricury wax, Japan wax, cork fibre wax, sugar cane  
wax, paraffin wax, lignite wax, microcrystalline waxes,  
lanolin wax, montan wax, ozokerites and hydrogenated  
5 oils such as hydrogenated jojoba oil as well as waxes  
of synthetic origin, for instance polyethylene waxes  
derived from the polymerization of ethylene, waxes  
obtained by Fischer-Tropsch synthesis, fatty acid  
esters and glycerides that are solid at 40°C, silicone  
10 waxes such as alkyl- and alkoxy-poly(di)methylsiloxanes  
and/or poly(di)methylsiloxane esters that are solid at  
40°C.

The composition of the invention also  
advantageously contains at least one polymer that is  
15 liposoluble or dispersible in the medium, especially  
having an average molecular weight of from 500 to  
1 000 000 and better still from 5 000 to 15 000. This  
(these) liposoluble polymer(s) contribute(s) in  
particular towards increasing the viscosity and/or  
20 improving the staying power of the film. These  
liposoluble polymers advantageously have a softening  
point of not more than 30°C.

As examples of liposoluble polymers which can  
be used in the invention, mention may be made of:  
25 polyalkylenes, in particular polybutene,  
poly(meth)acrylates, alkylcelluloses with a linear or  
branched, saturated or unsaturated C<sub>1</sub> to C<sub>8</sub> alkyl

radical, such as ethylcellulose and propylcellulose, silicone polymers that are compatible with the fatty phase, as well as vinylpyrrolidone (VP) copolymers, and mixtures thereof.

5                Vinylpyrrolidone copolymers, copolymers of a  $C_2$  to  $C_{30}$  and better still  $C_3$  to  $C_{22}$  alkene, and combinations thereof, are preferably used. As examples of VP copolymers which can be used in the invention, mention may be made of VP/vinyl acetate, VP/ethyl  
10 methacrylate, butylated polyvinylpyrrolidone (PVP), VP/ethyl methacrylate/methacrylic acid, VP/eicosene, VP/hexadecene, VP/triacontene, VP/styrene or VP/acrylic acid/lauryl methacrylate copolymer.

                 Preferably, not only for the staying power  
15 properties but also the feel and consistency properties of the film, the PVP/hexadecene copolymer having an average molecular weight of from 7 000 to 7 500 or alternatively the PVP/eicosene having an average molecular weight of from 8 000 to 9 000 is used.

20                The polymers that are liposoluble or dispersible in the composition of the invention are advantageously used in an amount of from 0.01% to 20% (as active material) relative to the total weight of the composition and better still from 1% to 10%, if  
25 they are present.

                 The composition according to the invention also advantageously contains at least one fatty

compound that is pasty at room temperature. For the purposes of the invention, the expression "pasty fatty substance" means fatty substances with a melting point ranging from 20°C to 55°C, preferably 25°C to 45°C, 5 and/or a viscosity at 40°C ranging from 0.1 to 40 Pa.s (1 to 400 poises), preferably 0.5 to 25 Pa.s, measured using a Contraves TV or Rhéomat 80 viscometer, equipped with a spindle rotating at 60 Hz. A person skilled in the art can select the spindle for measuring the 10 viscosity from the spindles MS-r3 and MS-r4, on the basis of his general knowledge, so as to be able to carry out the measurement of the pasty compound tested.

According to the invention, one or more pasty fatty substances are used. These fatty substances are 15 preferably hydrocarbon-based compounds, optionally of polymeric type; they can also be chosen from silicone compounds and/or fluoro compounds; they may also be in the form of a mixture of hydrocarbon-based compounds and/or silicone compounds and/or fluoro compounds. In 20 the case of a mixture of different pasty fatty substances, the hydrocarbon-based pasty compounds are preferably used in major proportion.

Among the pasty compounds which may be used in the composition according to the invention, mention 25 may be made of lanolins and lanolin derivatives such as acetylated lanolins or oxypropylenated lanolins, having a viscosity of from 18 to 21 Pa.s, preferably 19 to

20.5 Pa.s, and/or a melting point of from 30°C to 55°C, and mixtures thereof. It is also possible to use esters of fatty acids or of fatty alcohols, in particular those containing from 20 to 65 carbon atoms (melting point of about from 20°C to 35°C and/or viscosity at 40°C ranging from 0.1 to 40 Pa.s), such as triisostearyl citrate or cetyl citrate; arachidyl propionate; polyvinyl laurate; cholesterol esters, such as triglycerides of plant origin, such as hydrogenated plant oils, viscous polyesters such as poly(12-hydroxystearic acid), and mixtures thereof. Triglycerides of plant origin which may be used are hydrogenated castor oil derivatives, such as "Thixinr" from Rheox.

Mention may also be made of pasty silicone fatty substances such as polydimethylsiloxanes (PDMSs) containing pendent chains of the alkyl or alkoxy type containing from 8 to 24 carbon atoms, and having a melting point of 20-55°C, such as stearyldimethicones, in particular those sold by Dow Corning under the trade names DC2503 and DC25514, and mixtures thereof.

The pasty fatty substance(s) may be present in a proportion of from 0.1% to 60% by weight, relative to the total weight of the composition, preferably in a proportion of from 1-45% by weight, and even more preferably in a proportion of from 2-30% by weight, in the composition, if they are present.

The composition according to the invention may be manufactured by the known processes, that are generally used in cosmetics or dermatology. It may be manufactured by the process which consists in heating  
5 the polymer at least to its softening point, in adding the amphiphilic compound(s), the dyestuffs and the additives thereto and then in mixing everything together until a clear, transparent solution is obtained. After reducing the temperature, the volatile  
10 solvent(s) is(are) then added to the mixture obtained. The homogeneous mixture obtained can then be cast in a suitable mould such as a lipstick mould or directly into the packaging articles (case or dish in particular).

15 A subject of the invention is also a lipstick composition in stick form containing at least one continuous liquid fatty phase comprising at least one fluoro oil, the liquid fatty phase being structured with at least one non-waxy polymer giving the  
20 composition the appearance of an elastic deformable solid with a hardness ranging from 30 to 300 g (measured according to the cheese wire method described above), in the absence of wax.

This lipstick composition in stick form  
25 advantageously contains an additive chosen from fatty compounds that are pasty at room temperature, liposoluble polymers and mixtures thereof, as defined

previously. The non-waxy polymer is preferably a polymer whose skeleton comprises hydrocarbon-based units containing a hetero atom, as defined previously.

A subject of the invention is also a cosmetic  
5 process for caring for, making up or treating human keratin materials, and in particular the skin, the lips and integuments, comprising the application to the keratin materials of the composition, in particular the cosmetic composition, as defined above.

10 A subject of the invention is also the use of the combination of at least one liquid fatty phase containing a fluoro oil and of at least one polymer with a weight-average molecular mass of less than or equal to 100 000, comprising a) a polymer skeleton  
15 containing hydrocarbon-based repeating units containing at least one hetero atom, and b) optionally pendent and/or terminal fatty chains that are optionally functionalized, containing from 6 to 120 carbon atoms and being linked to these hydrocarbon-based units, in a  
20 cosmetic composition or for the manufacture of a physiologically acceptable composition, in order to reduce the transfer and/or deposit of traces of a film of the said composition, applied to the keratin materials, onto a support placed in contact with the  
25 said film and/or to improve the staying power of the said film and/or to obtain a non-sticky film. This film is also glossy and/or comfortable.

The invention is illustrated in greater detail in the examples which follow. The percentages are given by weight.

#### 5 **Example 1: Lipstick**

- with the: *which content and in which phase?*

##### *Phase A*

• Uniclear 100	18%
• Fluorosilicone (X22819 from Shin Etsu)	5%
• Castor oil	2%
• Hydrogenated isoparaffin	4%
• Isononyl isononanoate	4%
• Phenyltrimethylsiloxyltrisiloxane	8%
• Vinylpyrrolidone/1-eicosene copolymer	2%

##### *Phase B*

• Pigments	10%
• Hydrogenated isoparaffin	5%
• Liquid lanolin	5%
• Poly(12-hydroxystearic acid)	2%

##### *Phase C*

• Isododecane	25%
• Decamethyltetrasiloxane	10%

10           The pigment phase (B) is ground using a three-roll mill and introduced into the oily phase A preheated to 100°C, until the mixture is fully

homogenized. The volatile phase C is then added to the above mixture, cooled to 85°C. The resulting mixture is left in contact for 10 min and then cast into lipstick moulds.

- 5                      Applied to the lips, the lipstick forms a glossy, non-sticky film that has good transfer-resistance properties.

### **Example 2: Lipstick**

#### *Phase A*

- |  |     |
|--|-----|
| • Uniclear 100                             | 18% |
| • Castor oil                               | 8%  |
| • Hydrogenated isoparaffin                 | 5%  |
| • Isononyl isononanoate                    | 5%  |
| • Phenyltrimethylsiloxyltrisiloxane        | 8%  |
| 10 • Vinylpyrrolidone/1-eicosene copolymer | 2%  |

#### *Phase B*

- |                                |     |
|--------------------------------|-----|
| • Pigments                     | 10% |
| • Hydrogenated isoparaffin     | 5%  |
| • Liquid lanolin               | 5%  |
| • Poly(12-hydroxystearic acid) | 2%  |

#### *Phase C*

- |                           |     |
|---------------------------|-----|
| • Nonafluoromethoxybutane | 5%  |
| • Isododecane             | 22% |
| • Decamethyltetrasiloxane | 5%  |

The pigment phase (B) is ground using a three-roll mill and introduced into the oily phase A preheated to 100°C, until the mixture is fully homogenized. The volatile phase C is then added to the  
5 above mixture, cooled to 85°C. The resulting mixture is left in contact for 10 min and then cast into lipstick moulds.

The lipstick obtained deposits a glossy, non-sticky and transfer-resistant film.
